Abstract: PROBLEM TO BE SOLVED: To recover MAP and to obtain treated water having high water quality by efficiently removing phosphorus from a waste liquid such as a separated dehydrated liquid from a sludge wherein phosphate ions, ammoniacal nitrogen and calcium ions coexist by utilizing the MAP method (magnesium ammonium phosphate) and the HA(hydroxyapatite) crystallizing method.
SOLUTION: Waste water containing phosphate ions, ammoniacal nitrogen and calcium ions is passed upwardly through a reaction tower 1 and MAP is formed as an insoluble substance from the phosphorus ions in this waste water and separated in the presence of a magnesium compound. A mixed fluidized bed of MAP and HA particles are formed in this reaction tower 1.
